EXECUTIVE SUMMARY

This report documents investigations carried out Henry House, Lakeview Park, Oshawa, Ontario, between 22 August, 2011, and 3 September, 2011, by Trent University Oshawa as part of a Historical Field School course. Processing of the artefacts collected was conducted at the Trent University Oshawa campus between 8 September, 2011, and 6 December, 2011.

Henry House is a mid-19th century historic homestead situated on its original footings and located in Lakeview Park, Oshawa, Ontario. The site is maintained s part of the Oshawa Historical Museum and Archives under the direction of Ms. Laura Suchan. Although the house is known historically, and research about it and its occupants has been conducted by the Oshawa Historical Society (OHS: 2012) it has never been the subject of archaeological investigations.

In 2011, Trent University Oshawa (TUO) and the OHS collaborated to conduct excavations in the fenced in yard to the south and south-west of the house. These excavations were designed to provide additional information about the Henry Family (i.e., their social status, dietary choices) and possibly locate any undocumented outbuildings.

Archaeological investigations were carried out over the course of a two-week field season, 17 undergraduate students under the direction of Dr. Helen R. Haines (Assistant Professor TUO) and with the assistances of Mr. Alec McLellan (MA student TU). The area was initially gridded into 5 metre units with a test pit dug to a relative depth of 35 cm at every grid node. Five locations were selected for additional 1x1 metre excavation units. All excavation was carried out by hand using hand-trowels and the material was screened through 0.6mm mesh shaker screens. All artefacts were collected for later processing in the laboratory at TUO.

Material in the laboratory was processed and catalogue numbers were assigned in accordance with the Oshawa Historical Museum protocol. Information was catalogued and presented in this report in accordance with S&G recommended Canadian Parks Service *Classification System for Historical Collections*.

Based on the artefacts collected, it is believed that a small wooden shed, possibly a gardening shed, existed at one time near what is now the south-west corner of the yard. This is suggested based on the large number of nails, and shards of flat (window pane) glass recovered in this area. Excavations also allude to the possible presence of a previously undocumented root cellar to the south of the house. Ceramic material recovered indicated a quantity of English tableware with a few American made utilitarian kitchen wares. Excavations also yielded a large quantity of coal slag suggesting that the Henrys, and subsequent occupants, relied on coal and not wood to heat the house.

Also of interested was that despite being located quite close to the lake and the harbour, very little fish was recovered as part of the faunal assemblage (less than 3% of the overall assemblage compared to roughly 88% of the assemblage being mammalian in origin). Rather the Henrys seem to rely on more traditional British meat sources with domesticated cow, sheep, and pig dominating the identifiable mammal assemblage.

ACKNOWLEDGEMENTS

We recognise the cultural importance of Henry House to the City of Oshawa, both as a significant place for Oshawa's history and also as an important location for current community activities. As such we would like to thank the City of Oshawa for granting permission to excavate at the historic site of Henry House. We would particularly like to thank His Worship John Henry, Mayor of Oshawa, for his support of the project and participation in the inaugural excavations.

We also would like to acknowledge the support given to us by The Symons Trust Fund for Canadian Studies, Trent University. Funding provided by The Symons Trust Fund helped with the analysis of the artefactual material recovered.

1.0 INTRODUCTION – PROJECT CONTEXT

Archaeological investigations at Henry House, Lakeview Park, Oshawa, were conducted in the context of an archaeological field school and done in collaboration with the Oshawa Historical Society which manages the property and is responsible for executing the goals of the Oshawa Historical Society which include advancing knowledge and understanding of the history of the City of Oshawa (OHS 2013: 10).

Work at the site, and reported on in this document, consisted of Stage 2 and Stage 3 investigations. Research required for a Stage 1 survey was conducted by members of the Oshawa Historical Society and was published as a book in 2012 entitled *If This House Could Talk: The Story of Henry House*.

The degree of cultural heritage value was established by Ms. Laura Suchan, Director of the Oshawa Community Museum and Archives. The site is a mid-19th century historic house that initially served as a home for the first harbourmaster. As it is located on its original foundation, and is an important focal point for Oshawa history, investigation of the surrounding property was deemed worthwhile and in accordance with the goals of the Oshawa Historical Society and potential objectives of the nascent heritage management plan (*Culture Counts: The Oshawa Arts, Culture and Heritage Plan*) currently being created by the City of Oshawa. Currently, the house serves as a community museum.

Stage 2 Property Assessment was conducted as part of the field school research. This involved creating a 5 m grid along the south side of the house, primarily in the enclosed yard, and digging a test pit at each intersection (**Figure 1**). Testing pit survey was conducted as the area is enclosed within a fenced yard (**Plate 1**). The Henry House garden has been landscaped to reflect what was known about the 19th century Henry homestead (i.e., a grass area containing flower and herb gardens). As the garden is regularly used for community activities such as teas, social events, and weddings, test pits rather than ploughing were deemed to be less intrusive.

Once it was established that the yard did indeed contain potentially undisturbed material related to the 19th century occupation of the house and worthy of further investigation a Stage 3 Site-Specific Assessment was conducted. It should be noted that investigations were limited to the immediate house environs and did not extend throughout Lakeview Park due to permission constraints imposed by the City of Oshawa.

The Stage 3 Site-Specific Assessment consisted of five 1x1 metre units excavated in areas of high potential. High potential areas were considered locations where middens, out-buildings, or a root cellar were possibly situated. These features were deemed to have the greatest capability of contributing valuable knowledge about the occupants of Henry House and the early history of the City of Oshawa.

1.1 Development Context

The work conducted at Henry House was part of an archaeological field school and was not conducted as part of a Cultural Resource Management development project. The field school was carried out through Trent University Oshawa as part of the ANTH-2050h Introduction to Ontario Historic Archaeology Field and Laboratory Methods course.

Investigations at Henry House were carried out in collaboration with the Oshawa Historical Museum and Archives. Choice of Henry House as a location to investigate was made by Ms. Laura Suchan, Director of the Oshawa Historical Museum and Archives, and accords with the goals of the Oshawa Historical Society and potential objectives of the nascent heritage management plan (*Culture Counts: The Oshawa Arts, Culture and Heritage Plan*) currently being created by the City of Oshawa. Oshawa Municipal Heritage Management Plan. The collaboration between Trent University Oshawa and the Oshawa Historical Museum and Archives involves Trent University Oshawa supervising the student conducted excavations at Henry House and laboratory processing of material collected, with the Oshawa Historical Museum and Archives providing guidance regarding cataloguing techniques and housing the artefacts once collected and processed.

1.2 Historical Context

Henry House is a wood frame home dating to the 1840s. As such it falls in to the Historical period of Ontario's history, specifically the Euro-Canadian period dating from A.D. 1800 to present (see Table 1.). Neither archival research nor archaeological investigations revealed any occupation of the property prior to this point. Henry House is one of three historic houses constructed in what is now Lakeview Park, Oshawa. The other two houses, Robinson and Guy, also date to between 1835 and 1849, and all three houses are located on their original foundations. The houses each represent excellent examples of 19th century architecture. Henry House (ca 1849) was the home of Thomas Henry, an Elder in the Christian Church, a War of 1812 veteran and a key contributor to the development of Port Oshawa. Today there are very few 19th century wood structures remaining in Oshawa making Henry House and its neighbours an important part of The City of Oshawa's heritage.

In accordance with the MTSC 2011 *Standards and Guidelines for Consulting Archaeologist* domestic archaeological sites dating to after 1830 are deemed of cultural heritage value when the site has either (1) occupation dating to before 1870, or, (2) is associated with the first generation of settlement of a pioneer or cultural group, even when the settlement was after 1870. As Henry House has both an occupation dating to prior 1870 and is associated with the first generation of settlement of a pioneer group, the location is deemed to be of cultural heritage value and warranting archaeological investigation.

Table 1. Cultural Chronology for South Central Ontario.

1.2.1 History of Henry House and Lot 7 Broken Front Concession

In 1812, Eleazor Lockwood was granted the patent for 200 acres along the lakeshore of Lake Ontario. The 200 acres was lot 7 of the Broken Front Concession. During this time the Henry family was living in York and both John Henry and his son Thomas were participants in the War of 1812.

At the conclusion of the war John Henry moved his family to East Whitby Township. In a deed dated April 20, 1815 John Hanary (Henry) purchased 200 acres of lot 7 Broken Front Concession from Eleazor Lockwood for £300 (Oshawa Community Archives 1815: Document A967.5.1). The lot began at the shore of Lake Ontario, north to what it now Bloor Street. The deed outlines road allowances at the northern limits of the property, as well as between lots six and seven which will eventually be known as Henry Street. The lot was still uncleared and the family worked to clear it and built a home. It is unclear at this time, where John Henry built his family home.

In 1830, John Henry sold 130 acres of Lot 7 to his son Thomas (Oshawa Community Archives 1830: Document A967.5.2). As there is no mention of Lake Ontario in the land deed, the portion of the lot sold to Thomas 130 acres north starting at the creek. Thomas built a home on this lot, most likely a frame home, and lived here with his five sons from his marriage to Elizabeth Davis, and his new wife Lurenda Abbey.

In the 1930 obituary for Jesse E. Henry, the second youngest child between Thomas and Lurenda, states that shortly after Jesse was married, he brought his wife to live with him on the “old Henry farm at Oshawa-On-The-Lake, which is now known as the City Farm”. The 1929 Map of the Town of Oshawa shows the City Farm as being the northern portion of Lot 7, north of the creek. In his will, Thomas states that he had given or sold the north 100 acres of lot 7 to his son Jesse Ezra. In turn Jesse had sold his interest in this land to his brother Joseph Goran. The 1867 Map of East Whitby Township shows Joseph in ownership of the northern portion of lot 7.

The 1836 Warton Directory (Kaiser 1921: 206-216) lists both John Henry and Thomas Henry as owners of lot 7 Broken Front Concession. Sometime between 1836 and 1851 Thomas acquired the additional 70 acres of lot 7. It is unclear if he purchased the acreage from his father or if it was left to him in John Henry’s will (John Henry died in 1836). What is clear is that in 1851 Thomas and Lurenda sold the southern portion of lot 7, all the way to the shores of Lake Ontario, to his son George (Oshawa Community Archives 1851: Document A967.5.3). The 1851 census (Library and Archives Canada 1851) lists Thomas Henry as living in a one-story stone home with Lurenda and eight children.

In 1858 George Henry sold 18 of the 20 acres back to Thomas Henry (Oshawa Community Archives 1858: Document A967.5.4). He also sold 1 acre of land to Thomas Guy Jr. to be used as a road between lots 7 and 8 (Henry Street) (Oshawa Community Archives 1858: Document A967.5.4). George also sold 1 acre, believed to be the south east portion of the lot, to Samuel Phillips (Oshawa Community Archives 1858: Document A967.5.4).

In the 1861 census (Library and Archives Canada 1986), Thomas and Lurenda are listed as living in a one-storey stone house with nine children. In Thomas Henry’s will, dated June 13, 1879, Thomas states that he devises 50 acres of land, south of that which has been left for Joseph Goran, to his son William Thomas. It is this portion of the lot that the house in which Thomas was living before he passed away stands on. It also states that if she so chooses, Lurenda may

live in the house with William and his wife Elizabeth. The 1881 census (Library and Archives Canada 1881), shows the family is still living in East Whitby Township and Lurenda is in fact living with William and his family.

Around 1911, the land registry documents begin to show agreements between the Henry family and the Town of Oshawa. On May 2, 1911 Joseph G. Henry and his wife sold 142 acres to the Corporation of the Town of Oshawa for \$1000. Transactions continued between Henry and the Town in 1912 as more land was shifted between the two parties.

On July 3, 1913, William Henry put forth an offer to sell all of his farm property, 50 acres, on lot 7 Broken Front Concession to Charles Robson (Oshawa Community Archives 1913a: Document A986.0.5). By July 14, 1913, the papers were signed, and William had sold the south 50 acres of the lot, minus a small section at the very south east corner, to Charles Robson (Oshawa Community Archives 1913b: Document A986.40.6). Included in the 50 acres was the land on which Henry House sits. The small parcel of land that was held back from the sale was left in the name of William's wife, Eliza (Stone) Henry.

The 1916-17 Vernon's County of Ontario directory (Vernon 1916), states that William T. Henry was now residing on Lot 6 Broken Front Concession. It is possible that his family was now living on property owned by his brother Arthur. We know for certain that by 1921, William and his family were living at 92 Albert Street and his brother Arthur had also moved into Oshawa and was living at 73 Centre Street.

On July 15, 1914 Charles Robson signed an indenture selling the property that he had bought from William Henry to a party consisting of George McLaughlin, R.S. McLaughlin, May Schell and Thomas Edgar Houston (Oshawa Community Archives 1914: Document A986.40.9).

Finally, on June 1, 1920 Eliza Henry conveyed ownership of the south eastern portion of the lot to Charles Robson (Oshawa Community Archives 1920: Document A986.40.12).

The land registry documents from the period between 1917 and 1925 are almost entirely illegible. What is discernable is that during the 1919 several mortgages held on this lot were discharged. Shortly after this, during the 1920, several of the land titles were granted to someone.

Presumably, these two events were tied to the purchase of the property by the McLaughlin brothers who then granted it to the Town of Oshawa.

Between 1917 and into the early 1920's, Henry House was rented by the Mackie family. Alex Mackie tended to the families horses in barns that were of a U-shaped construction. It is thought that these were located to the northwest of Henry House. It seems that during this time (1917 – 1922), some rooms in Henry House were rented out to young girls in the neighbourhood.

After the Mackie Family moved out, the house became a central part of the park. "For three or four years [in the 1920s] the local Council of Women, functioning at the time, turned one of the front rooms into a restroom for mothers with small children. They could rest there while the children were playing at the park." It even served as a shelter for people using the street car on Simcoe Street.

Nason and Emelline [Ned and Lina] Smith lived in Henry House from the 1930s up until his death in 1942. Ned's nephew William Campbell lived with the couple for a while and helped his

Uncle Ned tend to and feed the buffalo that were in the park. They also planted many of the trees in Lakeview Park. The family remembers hearing about all of the family picnics that took place down at Henry House. Ned was also a motorman on the Oshawa Railway during the 1930s.

After Ned Smith passed away, it seems that another Smith family lived in Henry House. Mr. Harry Smith, employee of the Parks Board of Management and in charge of maintenance work at Lakeview Park, and his wife had been living in the home when a devastating fire broke out on Saturday November 29th, 1958.

“The rear of the house, as well as the heavy beams, dating back to the time when the house was erected in the early 1850s was constructed, were destroyed. The roof was destroyed and much of the interior suffered heavy damage from fire and water.”

On March 20th, 1959, members of the Oshawa Durham Historical Society (now the Oshawa Historical Society) received the news that they could use Henry House as a local museum. They would have just over one year to make the house and collection presentable to the public. Henry House was set to open on May 21st, 1960.

1.3 Archaeological Context

According to Robert von Bitter, MCL Data Coordinator (personal communication 20 November, 2012), there are two site listed in the Ontario Archaeological Sites Database near the site of Henry House. Of these only AlGq-113, an unnamed site, is within a 1 km radius from the Henry House (0.77 km distance). The Williamson site, an find-spot of undetermined cultural origin, is located 1.57 km distant from the site (**Figure 2**).

Currently the site of Henry House has been restored into a heritage house and museum for the community of Oshawa. The lands around the site, and the property on which the house sits, is part of the Oshawa Lakeview Park. The immediate area to the south of the house is enclosed in a garden fence to form a yard for the house and it is within this area that the excavations were conducted. Immediately to the north of the house is a small carriage shed while paved paths run in front of the house on the east side and along the south side of the fenced yard. Further to the southwest, approximately 40 metres, is a developed park restaurant kiosk and interlocking stone patio. A parking lot exists between 15 and 20 metres to the west of the house.

Two additional historic houses, Robinson House and Guy House, exist in the park. Both houses are under the administration of the Oshawa Historical Society. Robinson House, dating to the 1840s, was restored and also serve as a museum. Guy House was renovated and serves as the home of The Oshawa Community Museum and Archives.

Restoration work at Henry House was completed in the 1960. Historical research of the house has been conducted by the Oshawa Historical Society and has resulted in a publication, *If This House Could Talk: The Story of Henry House*, produced and printed by the Oshawa Historical Society in 2012.

Archaeological work was conducted at Henry House between 22 August, 2011, and 3 September, 2011. Processing of the artefacts collected was conducted at the Trent University Oshawa campus between 8 September, 2011, and 6 December, 2011. This was the first archaeological investigations conducted at Henry House.

Soils around the house are poorly drained and frequently marshy conditions exists to the north. A modern sump-pump was installed beneath Henry House to keep the basement from flooding. Currently, the poor drainage condition of the soil are resulting in Henry House sinking in one corner.

As this was the first archaeological investigation of the site, work commenced with a Stage 2 survey with test pits placed every 5 metres (**Figure 1**). This were excavated to a depth of 35 cm and all material was screened through 0.6 mm (¼ inch) mesh sifters. Based on the material recovered, five 1x1 metres units were excavated. Based on the material recovered Henry House was issued the Borden Designation AIGq-134.

2.0 LOCATION AND DESCRIPTION

Henry House is part of the Oshawa Community Museum complex located in Oshawa's Lakeview Park. The Oshawa Community Museum consists of three restored heritage homes, Henry, Robinson and Guy, dating from 1835 – 1849 all located on their original foundations. The houses each represent excellent examples of 19th century architecture. Henry House (ca 1849) was the home of Thomas Henry, an Elder in the Christian Church, a War of 1812 veteran and a key contributor to the development of Port Oshawa. Its 1.5 storey, limestone design makes it unique in the Oshawa area. Robinson House (ca 1846), home to Quaker John Robinson, features characteristics of Dutch Colonial architecture with a gambrel roof which incorporates an architecturally and structurally prominent two tiered verandah. It was constructed of locally made yellow brick. Guy House (ca 1835) was at one time home to James Odgers Guy, Harbourmaster at Port Sydenham. The wood frame structure and its trim are typical Georgian architectural details. Today there are very few wood structures remaining in Oshawa and Guy House is believed to be the oldest of this design still standing.

3.0 HISTORY OF INVESTIGATIONS AT HENRY HOUSE

Henry House has been the subject of on-going historical research and restoration work since its acquisition by the City of Oshawa in 1959. More recently, in 2011, it was subjected to the first ever archaeological investigation of the property. As Henry House sits on its original foundations it was deemed that an archaeological investigation of the property might provide a fuller understanding of the socio-economic standing and dietary preferences of the Henry family.

3.1 Historical Research

Henry House came into the possession of the Oshawa Historical Society in 1959. Historical research of the house and the Henry family has been conducted since this time by the Oshawa Historical Society. This work has resulted in a publication, *If This House Could Talk: The Story of Henry House*, produced and printed by the Oshawa Historical Society in 2012. The history of Henry House is summed up in section 1.2.1 *History of Henry House and Lot 7 Broken Front Concession*.

3.2 Archaeological Research

Henry House, has been long recognised as a historically important structure and its value to the history and heritage of Oshawa is clear to anyone who has walked through its front door. However, Henry House is also important for what cannot be easily seen to the visitor: in particular, it is important for its original foundations. The fact that Henry House sits on its original foundation means that the land around the house, while modified through time during the creation of Lakeview Park and the addition of paths for ease of access, is essentially still the same land that the Henry's used. Consequently, traces of their lives, and those of succeeding occupants may still be found below the surface of the ground.

To seek out these traces in 2011, Henry House became the focus of an archaeological investigation. This research was conducted as a joint initiative between the Oshawa Community Museum and Trent Oshawa University and was carried out as part of a Ontario historical field school. Excavations were carried out by a team of undergraduate students under the supervision of Dr. Helen Haines (Association Professor Trent Oshawa University) and Laura Suchan (Director, Oshawa Community Museum). While Henry House has been the focus of considerable historical research on the part of the members of the Oshawa Community Museum it had, until this point, never been subject to archaeological excavation.

Excavations focused on the enclosed yard behind and to the south of Henry House. The logic for this choice was that this area was adjacent to the rear kitchen doors of the house and was likely the location of household middens (garbage dumps), root cellars, outhouses, and other out-buildings. The aim of the project was to ideally locate either the household midden or outhouse as these two areas were likely to yield the most revealing artefacts. While household middens are where general refuse is disposed (e.g., food remains, broken dishes, etc.), outhouses often contain items that were either accidentally lost or deposited with the intention of them not being seen or found. In Ontario, wells Ontario are also known to preserve objects, and to have been used to deposit objects when a house is abandoned. However, the proximity of the house to Lake Ontario and the existence of a nearby creek make it unlikely that the Henry's would have expended the effort to dig a well when abundant sources of fresh water were near at hand.

4.0 FIELD METHODS

Archaeological investigations at Henry House were conducted in compliance with the archaeological fieldwork standards and guidelines laid out by the Ministry of Tourism and Culture in the 2011 *Standards and Guidelines for Consulting Archaeologists*. Work at the site, and reported on in this document, consisted of Stage 2 and Stage 3 investigations. Research required for a Stage 1 survey was conducted by members of the Oshawa Historical Society and was published as a book in 2012 entitled *If This House Could Talk: The Story of Henry House*.

4.1 Survey Methodology

As the area had never been subjected to an archaeological survey prior to the 2011 Field School, the area was overlain with a 5 metre grid and 30 cm wide test pits were excavated at every 5 metre grid co-ordinate in accordance with the 2011 *Standards and Guidelines for Consulting Archaeologists* (**Figure 1**). As the garden is regularly used for community activities such as teas, social events, and weddings, test pits rather than ploughing were deemed to be less intrusive.

A datum point was set up in the yard using the fence posts as a guide with a back-shot taken to the fire-hydrant to the east of the yard.

While the majority of the test pits excavated were located within the confines of the formal yard a few pits were excavated outside the fenced area to determine if the original house land-use extended beyond the current yard. Several grid locations were unsuitable for excavation due to the presence of paved pathways. It should be noted that investigations were limited to the immediate house environs and did not extend throughout Lakeview Park due to permission constraints imposed by the City of Oshawa.

A total of 45 test pits were excavated to a relative depth of 35 cm (Plate 2), with 32 pits yielding artefactual material (**Table 4**). Once it was established that the yard did indeed contain potentially undisturbed material related to the 19th century occupation of the house and worthy of further investigation a Stage 3 Site-Specific Assessment was conducted.

4.2 Excavation Methodology

The Stage 3 Site-Specific Assessment consisted of five 1x1 metre units excavated in areas of high potential (Plate 3). High potential areas were considered locations where middens, out-buildings, or a root cellar were possibly situated. These features were deemed to have the greatest capability of contributing valuable knowledge about the occupants of Henry House and the early history of the City of Oshawa. After excavation the units were backfilled and the area was returned to as close to the original state as possible (Plate 4: note that grass seed was planted in surface of unit).

Following Ontario archaeology standard practices these units were identified by their southwest corner grid co-ordinates. The five units excavated were located at 905N-900E (Team 1), 905N-885E (Team 2), 905N-890E (Team 3), 900N-890E (Team 4), and 900N 885E (Team 5). The location of these units was designed to optimise the labour resources as well as balancing the desire for a systematic coverage of the area with the goals of locating key features as noted above.

All units were excavated by hand using masonry hand-trowels and material was screened through 0.6 mm (¼ inch) sieves. All artefactual material was collected for processing. Excavations were conducted by undergraduate students from Trent University Oshawa and supervised by Dr. Helen R. Haines (License P124) with the assistance of Alec McLellan an MA student in the archaeology graduate programme at Trent University.

Teams of students were each assigned a unit and students, while rotated out to learn theodolite/mapping techniques were not moved between units. The composition of the teams were as follows:

905N-900E – Team 1	905N-885E – Team 2	905N-890E – Team 3
• Kimberly Ridout	• Lisa Mercier	• Kathryn McGeean
• Kenneth Johnstone	• Adrian Susac	• Allyson Groom
• Jessica Brook	• Monica Effenger	• Meagan Bailey
		• Nicholas Dobos
900N-890E – Team 4	900N 885E – Team 5	
• Hoa Lu	• Corena Ryan	
• Teresa Van Schaik	• Maura Brannigan	
• Sara Nicholson	• Sally Charbonneau	
	• Cindy Donovan	

Each student, along with documenting their work on standardised lot/level forms, was required to keep a detailed field journal of their excavations. These journals, along with all other documentation (lot/level forms, mapping forms, artefact catalogue records, and maps) were filed with the Oshawa Historical Society and Community Archives upon completion of the investigations.

4.3 *Stratigraphic Description and Analysis*

The following section details the archaeological levels and stratigraphic layers encountered in each of the five excavated units.

4.3.1 *Unit 905N-900E – Team 1*

Unit 905N-900E was perhaps the most complex unit excavated during the 2011 field season (**Figures 3 and 4**). The initial three layers were similar to the majority of the other units in that they consisted of an initial layer of sod (Level 1), followed by a layer of top soil (Level 2), then a layer of soft grey-brown soil that was arbitrarily divided into two levels (Level 3 and Level 4) due to the thickness of the stratum. The stratum that comprised these levels, while similar in appearance and consistency to that in the other units was notably different in the artefact composition. The artefact collection from this stratum contained significantly larger pieces of tableware including many pieces of transferware, and two coins (see Section 5.0 below).

Subsequent to this stratum a line of large rocks (10-20cm) was encountered in in south-west quadrant that ran diagonally across unit from middle of south wall to northwest corner. The area to the east of this ‘wall’ was excavated as Level 5, while the rock feature was identified as Level 6 (Plate 5). Nothing of note was recovered in Level 5 which was closed when a layer of rocks (Level 7), similar to layers found in Units 900N-890E and 900N-885E, was encountered.

While the rock feature identified as Level 6 was not removed, matrix between the upper stones was cleared and a large piece of stoneware found in close association with large piece of black/brown transferware was recovered from this matrix.

Level 7, which was located only on the east half of the unit, contained a large piece of wood, possible a beam and numerous, large well preserved mammal bones, the largest and best preserved faunal material recovered. A small semi-circular brown feature was noted at the junction of the wall and rocky layer (Levels 6 and 7 respectively); this feature was excavated as Level 8 and proved to be a shallow (ave. 5 cm) depression with nothing of note being recovered.

The unit was closed at a layer of sterile grey/yellow clay (Level 9). This matrix was unlike the material at the close of the other units which was a typical mottled yellow-brown sandy sterile soil. The exception was the east half of Unit 905N-890E which also yielded a compact ash grey clay matrix.

4.3.2 Unit 905N-885E – Team 2

Unit 905N-885E was excavated in seven archaeological levels with comprised six different strata (**Figure 5**). Level 1 consisted of removal of the grassy sod covering the yard. This layer was consistent in all units. Below this level was layer of dark brown soft topsoil (Level 2). Level 3 consisted of a soft grey-brown soil similar to the matrix found in surrounding units at this point. It was arbitrarily closed at a thickness of 20 cm. Level 4 continued excavated in this matrix and subsequently material from this two levels may be considered to come from the same strata.

Level 5 was identified based on change in the soil strata and was the most productive of the stratum with large pieces of ceramics (tablewares) and bone being recovered. The layer/level consisted of a dense matrix of small, relatively flat stones approximately 5 cm on average that stretched across the entire unit. This layer was similar to that found in Units 900N-890E and 900N-885E, however, the stones in these two units were somewhat larger.

Immediately below this rocky layer was a stratum of hard brown/grey clay (Level 6) followed by the typical mottled yellow-brown sandy sterile soil. The unit was closed at this point.

4.3.3 Unit 905N-890E – Team 3 (Garden)

Unit 905N-890E was situated partially in the modern herb garden and was a highly complex unit due, not only to the garden disturbance, but also to the brickwork forming the edging and bisecting the garden (**Figures 6 and 7**). The area was chosen for excavation due to the recovery of a large piece of a mulberry transferware plate in the associated test pit.

In order to excavate this area it was first necessary to remove the brickwork edging. This was accomplished initially by removing the small area of sod along the east edge of the unit (Level 1). Beneath this area the metal cladding that formed the framework and support for the brickwork was encountered. As this cladding extended beyond the confines of the unit it was decided not to excavate this area, resulting in the unit being narrowed approximately 10 cm along the east edge.

Following the removal of the sod, the recent layer of black top-soil placed on the garden surface was removed (Level 2). This permitted the clearing and defined of the edges of the brickwork and subsequent supporting pebble substrata which were excavated as a single stratum (Level 3) as

they formed a discrete event. The remaining garden soil was excavated until it was level with the bottom of the pebble aggregate and this material comprised Level 4.

Below this level was a layer of soft black-brown moist earth (Level 5). This was the only layer in which rocks were encountered, but the quantity and distribution of the rocks were not on par with rocky layers in Units 905N-885E, 900N-890E, or 900N-885E. Within Level 5 was an area of hard and very compact, dry, greyish soil that was possibly a shallow pit (Level 6).

Levels 5 and 6 were followed by a layer of dark grey clay containing numerous ceramic pieces (Level 7). Below this layer the matrix divided with ash grey clay matrix being encountered on east half of unit while the west ½ of unit sterile yellow-brown sandy soil. Both of these matrixes were sterile and identified as Level 8 for closing purposes. The unit was closed at this level.

4.3.4 Unit 900N-890E – Team 4

Unit 900N-890E was an exceeding straightforward unit (**Figure 8**). It was excavated in five discrete levels, each of which was found distributed evenly across the surface of the unit. The initial three layers were similar to those found in Units 905N-900E, 905N-885E, and 900N-885E in that they consisted of an initial layer of sod (Level 1), followed by a layer of top soil (Level 2), then a layer of soft grey-brown soil (Level 3). Unlike Unit 905N-900E, however, the Level 3 stratum was not significantly deep enough to warrant division into two levels. Subsequent to these strata was a layer of 5-10 cm rocks in a sandy matrix. The rocks were smooth and tightly packed in a relatively horizontal fashion. Below this rocky matrix was a layer of sandy yellow-brown sterile soil. The unit was closed at this point.

4.3.5 Unit 900N-885E – Team 5

The initial four levels in Unit 900N-885E correspond exactly to those encountered in Unit 900N-890E and, in regards to the initial three levels to those found in Units 905N-900E and 905N-885E (**Figure 9**). Levels 1 through 4 consist of an initial layer of sod (Level 1), followed by a layer of top soil (Level 2), then a layer of soft grey-brown soil (Level 3), and finally by a layer of smooth, tightly packed 5-10 cm rocks in a sandy matrix (Level 4). While this level was identical in composition to that found in 900N-890E it was also similar to Level 5 in Unit 905N-885E, the difference being that the rocks in the later unit were smaller. Below this rock layer, however, was a layer of ash grey-brown soil (Level 5), atypical of the other units. Level 5 was followed by a layer of sandy yellow-brown sterile soil. The unit was closed at this point.

5.0 RECORDS OF FINDS

A total of 3146 artefacts were recovered through the course of excavations (Table 2); 551 of these pieces were recovered from 32 test pits (Table 3), the remaining 2595 objects were recovered from the five 1x1 metre units. Using the Canadian Parks Service *Classification System for Historical Collections* for referencing historic material the recovered artefacts fell into all four groups (Shelter, Tools and Equipment, Communication, and Unknown), but only eight of the ten categories (the missing categories were 07-Distribution and Transportation Artefacts and 09-Recreational Artefacts).

5.1 Summary of Total Collection

The majority of artefacts recovered (n=1481; 47% of the total collection) were 10-Unclassifiable Artefacts: J020-Artefact Remnants. Of these, 495 were undetermined metal fragments, 454 items were bits of coal slag, 237 pieces were wood fragments, and 188 were bone fragments (See Appendix II). It should be noted that due to the fragmented nature of some of the bones, refitting was possible making for 153 faunal pieces (see section 4.3.3 and Appendix I).

The largest category of identifiable objects is 04-Tools and Equipment for Materials (n=1142; 36.3%). Unidentified Glassware and Unidentified Tableware comprise the majority of this collection (n=417 and n=367 pieces; 36.5% and 32.8% of this category respectively), followed by nails (n=245; 21.5% of this category)

Notable objects recovered include two coins, two cobalt blue glass beads, and a fragment from a slate writing board. Both coins and the slate writing board fragment were recovered from Unit 905N-900E. One coin, stamped 1885 was found in Level 3 along with the writing board fragment, the second coin, marked 1820 was found in Level 4. It has been suggested that this latter 1820 coin was possible 'merchant token' (pers. comm. D. Galbraith Aug 30, 2011)

The two glass beads were recovered from different units; one bead came from Unit 900N-890E Level 3, while the second bead was recovered in Unit 900N-885E Level 4.

by Category, Sub-Category, and Object Classification**

5.2 Summary of Artefacts Recovered from Test Pits

A total of 551 artefacts were recovered from 32 test pits (Table 3). As with the total collection the majority of objects 10-Unclassifiable Artefacts: J020-Artefact Remnants (n=255; 46.3% of the Test Pit collection). Of these items, coal slag comprised the largest material (n=138).

The largest identifiable category of objects was 04-Tools and Equipment for Materials (n=159; 28.9% of the Test Pit collection). Within this category an equal amount of glassware and tableware were recovered (n=57 each) with a large number of nail (n=38) also being recovered.

The third largest category of objects were 01-Structure components. This category consisted of 134 objects (24.3% of the collection) with a large number of pieces (n=67) being unclassified bits (likely brick and/or mortar fragments) followed by identifiable brick fragments (n=46).

Table 3. Summary of Artefacts Recovered From Test Pits During the 2011 Field Season by Category, Sub-Category, and Object Classification

Test Pit 910N-900E had the largest number of objects recovered (n=97), over double the next more prolific test pits (915N-890N and 910N-895E with 42 objects each). Regardless of these high quantities of material these areas were not selected for further investigation. The rationale for discounting these areas was due to the nature of the material found and their proximity to the historic house.

The majority of the objects recovered from 910N-900E was pieces of coal slag (n=40) followed by unclassified building components (n=25) and wood fragments (n=17).

The majority of the objects recovered from 915N-890E also was pieces of coal slag (n=14), followed by mortar fragments (n=10) and nails (n=8).

The majority of the objects recovered from 910N-895E was again pieces of coal slag (n=16) followed by unclassified building components (n=10).

The five test pit survey areas that were chosen for further investigation were locations 900N-885E, 900N-890E, 905N-885E, 905N-890E, and 905N-900E.

Only one object was recovered from 900N-885E, an unidentified piece of glassware. This area, however, was selected to create a systematic arrangement.

A total of 25 objects were recovered from 900N-890E. Food Service items comprised the largest single type of objects recovered (n=8), followed by Woodworking Tools and Equipment (n=7). This area was selected for excavation due to the high number of ceramic tableware items.

A total of 20 objects were recovered from 905N-885E. Building Components comprised the largest single type of objects recovered (n=8), followed by Artefact Remnants (n=7), the majority of which were pieces of coal slag (n=5). This area was selected for excavation due to the curious present of building component at this distance from the house.

A total of 39 objects were recovered from 905N-890E. Although the majority of pieces were Artefact Remnants (n=24), of which a high proportion was coal slag pieces (n=18), this area was chosen for excavation based on a large piece of mulberry transferware plate recovered during test pitting operations.

Only 9 objects were recovered from the test pitting of 905N-900E. However, 8 of these were identifiable, well-preserved faunal fragments. Consequently, this area was chosen for further investigation in the hopes of uncovering a midden (although it is recognised as being close to the house) or root cellar.

**Table 4. Summary of Artefacts Recovered From Test Pits During the 2011 Field Season
By Test Pit, Category, Sub-Category, and Object Classification**

5.3 Summary of Artefacts Recovered from Excavation Units

Objects were categorised by their base material and separated, by unit, into their natural strata to identify key levels of occupation and/or areas of high artefact deposition. Unit 900N-885E yielded the largest artefact assemblage with 980 objects being recovered (Table 9). Units 905N-890E (Table 7) and 905N-885E (Table 6) also had high artefact collections (n=633 and n=423 respectively). Only 330 artefacts were recovered from Unit 905N-900E (Table 5), while Unit 900N-890E (Table 8) produced the smallest collection of artefacts with only 229 pieces.

Although Unit 900N-885E had the largest collection of artefacts (n=980), the greatest part of this assemblage consisted of metal objects (n=460; 46.9%). This was far in excess of the quantities recovered in other units which yielded 182 pieces in both Units 905N-890E and 905N-885E, and 114 pieces in Unit 900N-890E, and 74 items in Unit 905N-900E. Despite the disparately large quantity, the metal objects recovered in Unit were proportional to those recovered in several other units (42.0% in Unit 905N-890E), including Unit 900N-890E which, although having the smallest artefact assemblage, actually had a larger proportion of metal objects recovered (49.8%).

5.3.1 Ceramics

The largest collection of ceramic remains was recovered from Unit 905N-885E (n=311; 46.9% of unit collection), however, over half of these (n=187; 28.2%) were building components (i.e., brick) or household accessories (i.e., flower pots) and not food service or food related items (n=124; 18.7%). Although the largest *quantity* of food service/processing was from Unit 905N-

885E (n=124), conversely, this unit also had the smaller proportion of these items (9.7%). However, the second largest quantity of food service/processing items (n=95) came from Unit 900N-885E.

The largest **proportion** of food service and/or processing items were recovered from Unit 905N-900E (n=70; 21.2%) with only 10 items (3.0%) being deemed building components or household accessories. The second largest proportion of food service and/or processing items came from Unit 905N-890E with 20.0% of the assemblage (n=87) falling into this group, while only 2 ceramic items (0.5%) were building components or household accessories. While Unit 900N-890E had a smaller proportion of food service/preparation items (n=39; 17.0%) the overall proportion of ceramics in the collection was similar to that of Unit 905N-900E (21.4%).

5.3.2 Glass

The largest collection of ceramic remains was recovered from Unit 900N-885E (n=237), this unit also had the largest proportion of glass in its assemblage (24.1%). However, the largest amount of this material (n=171; 17.4%) was building components (i.e., flat glass), with only 65 pieces (6.6% of the overall assemblage) being related to food service or processing.

Although Unit 905N-885E has the second largest quantity of glass (n=82) it had the third largest proportion (n=12.4%) after Unit 900N-890E where glass comprised 17.5% of the overall collection (n=40). However, all 82 pieces of glass from Unit 905N-885E were food service/processing related items, both the largest collection in terms of quantity and proportion. Units 905N-890E and 905N-900E both had similar quantities and proportions of glass (n=39 and 31; 9.2% and 9.4% respectively). However, Unit 905N-890E had substantially more building components (n=24; 5.7%) compared to Unit 905N-900E (n=12; 3.6%). The amount of food service items in these units was very similar with Unit 905N-900E having slightly more objects (n=19; 5.8%) than Unit 905N-900E (n=15; 3.5%).

5.3.3 Unit 905N-900E

The majority of objects recovered came from the stratum immediately below the sod (Levels 2 and 3). This stratum yielded 121 objects in total. The succeeding rocky stratum (Level 4) and levels down the east side of the unit (the west side being an unexcavated potential wall) also yielded large numbers of artefacts.

Material	TOTAL Material	Level 1 Sod	Level 2&3 Topsoil	Level 4 Rocks	Level 5	Level 6 Rock 'wall'	Level 7 Rocks	Level 5/7 Mix	Level 8
Bone	48	0	19	7	1	2	17	2	0

Metal	74	0	43	23	4	0	0	4	0
Plant/Botanical	62	0	12	14	13	11	4	8	0
Plastic	0	0	0	0	0	0	0	0	0
Stone	35	0	8	11	11	1	4	0	0
Total	330	0	121	66	48	21	56	16	2

Table 5. Summary of Artefacts Recovered From Unit 905N-900E by Base Material and Level

5.3.4 Unit 905N-885E

This unit produced a surprising number of artefacts (Table 6) from the initial sod layer (Level 1) and succeeding topsoil stratum (Level 2). The largest quantities, and proportions of material from these levels were ceramics (n=106 ; 73.6% and n=108 ; 67.1% respectively). Level 5, immediately above sub-soil also yielded a large number of artefacts (n=161), of which the largest quantity was ceramics (n=71); however, here the relative proportion of ceramics was lower (44.1%) and was off-set by the higher proportion of metal objects (35.4%).

Material	TOTAL Material	Level 1 Sod	Level 2 Topsoil	Level 3 & 4 Brown/Grey	Level 5 Rocks	Level 5 Grey/Brown Clay	Level 6 Sub-soil
Bone	29	1	7	3	2	15	1
Ceramic	311	106	108	19	7	71	0
Glass	82	17	15	30	4	16	0
Metal	182	20	25	67	13	57	0
Plant/Botanical	14	0	1	10	3	0	0
Plastic	8	0	4	4	0	0	0
Stone	4	0	1	2	1	0	0
Unknown	3	0	0	1	0	2	0
Total	633	144	161	136	30	161	1

Table 6. Summary of Artefacts Recovered From Unit 905N-885E by Base Material and Level

5.3.5 Unit 905N-890E

The largest collection of objects from the garden came from the stratum and feature (Levels 5 and 6 respectively) immediately above the closing clay and sub-soil level (Levels 7 and 8 respectively) (Table 7). Levels 5 and 6 yielded over half the artefacts recovered (n=292; 69.0%). Of these the largest category of artefacts were metallic in nature (n=132; 45.2% of the strata and 31.2% of the total assemblage).

Material	TOTAL Material	Level 1 Sod	Level 2 Black Soil	Level 3 Pebbles	Level 4	Level 5	Level 6	Level 7	Level 8
Bone	39	0	0	0	6	23	2	8	0
Ceramic	89	1	18	2	9	44	3	9	3
Glass	39	0	0	0	4	29	2	4	0
Metal	182	0	3	0	3	124	8	44	0
Paper	1	0	0	0	0	1	0	0	0
Plant/Botanical	35	0	0	0	0	29	4	1	1
Stone	38	0	0	0	0	24	0	14	0
Total	423	1	21	2	22	274	18	80	4

Table 7. Summary of Artefacts Recovered From Unit 905N-890E by Base Material and Level

5.3.6 Unit 900N-890E (Hoa)

This unit produced the smallest collection of artefacts from the five excavated units (n=229; 9.2% of material recovered from excavated 1x1 metre units). The most productive layer was Level 3, a stratum of brown/grey soil above the rocky layer immediately prior to the subsoil (Table 8). This

stratum yielded 94 objects (41.0% of the unit assemblage), of which almost half were metal items (n=46; 48.9% of the layer).

Material	TOTAL Material	Level 1 Sod	Level 2 Topsoil	Level 3 Brown/Grey	Level 4 Rocks	Level 5 Interface	Level 6 Sub-soil
Bone	18	0	4	7	4	3	0
Ceramic	49	1	14	22	3	9	0
Glass	40	1	10	15	6	7	1
Metal	114	0	25	46	26	16	1
Plant/Botanical	0	0	0	0	0	0	0
Plastic	1	0	0	0	1	0	0
Stone	6	0	1	4	0	1	0
Unknown	1	0	1	0	0	0	0
Total	229	2	55	94	40	36	2

Table 8. Summary of Artefacts Recovered From Unit 900N-890E by Base Material and Level

5.3.7 Unit 900N 885E

Over half of the artefacts recovered (n=663; 67.7%) came from the layer of rocks near the bottom of the unit, with the layer immediately above also yielding substantially higher quantities of material (n=244; 24.9%) than the remaining strata (Table 9). A large quantity of these items were metallic (primarily nails) and shards of paned glass.

Material	TOTAL Material	Level 1 Sod	Level 2 Topsoil	Level 3 Brown/Grey	Level 4 Rocks	Level 5 Ash Grey/Brown	Level 6 Sub-soil
Bone	31	2	0	0	28	1	0

Stone	4	0	1	2	1	0	0
Total	980	19	21	244	663	32	1

Table 9. Summary of Artefacts Recovered From Unit 900N-885E by Base Material and Level

5.4 Preliminary Artefact Analysis

Artefacts were classified using the Canadian Parks Service *Classification System for Historical Collections* for referencing historic material. A total of 3146 artefacts were recovered through the course of excavations (Table 2); 551 of these pieces were recovered from 32 test pits (Table 3), the remaining 2595 objects were recovered from the five 1x1 metre units. The recovered artefacts fell into all four groups (Shelter, Tools and Equipment, Communication, and Unknown), but only eight of the ten categories (the missing categories were 07-Distribution and Transportation Artefacts and 09-Recreational Artefacts).

5.4.1 Ceramic Artefacts

A total of 739 ceramic objects were recovered; 631 objects were recovered from the five 1x1 metre units (Table 10), the remaining 108 of these pieces were recovered from 32 test pits (Table 11). The largest category of objects was “D120 Food Service/Unidentified Tableware” (n=375), a number of “D100/120 Food Servicing or Processing” and “D100-Food Processing” items were also recovered (n=83 and n=7 respectively). Ceramic objects also include 255 A040-Building Component (i.e., brick fragments) and 19 B080-Household Accessory (i.e., flower pots).

Food Processing and/or Food Service items included items made from Porcelain (n=5), Stoneware (n=85), and Earthenware (n=331), along with several items that were undeterminable (n=44). Two of the Stoneware items were salt glazed.

Creamware/Whiteware pieces comprised the largest category of identified ceramics (n=124); there were also 157 pieces of unidentified Earthenware objects. The D120-Food Service items included a variety of items decorated with Edgware (n=4), Featheredge (n=5), Shell Edged (n=15), and Transferware prints (n=19). The Transferware included black, brown, and Mulberry transfers along with two pieces of Blue Willow Ware (Appendix II).

Objects of note include a single piece of ceramic decorated with a brown glaze with white dots (**Plate 6**) from Unit 905N-900E Level 3 Topsoil stratum. It was identified as a piece of Annular Ware dated to between AD 1800-1825 (Orser personal communication).

No identifiable maker marks were detected on any of the items recovered, nor were any of the items identifiable to exact form/function (e.g., tea cup, saucer, plate).

Overall the collection of ceramics is predictable for a 19th century European household of moderate means with some Stoneware household items and finer Earthenware tableware. Most of the discernable patterns appeared indicative of English transferware patterns, although no sherd was large enough for an exact identification of the pattern to be made.

Table 11. Summary of Ceramics Recovered by Test Pit.

5.4.2 Glass Artefacts

A total of 495 pieces of glass were recovered from the excavations and test pits; 429 pieces were recovered in the five 1x1 metre units (Table 12), while the remaining 66 objects were recovered from the test pits (Table 13). D120-Food Service items comprised the largest category of objects (n=252; 50.9%) with A040-Building Components comprising the second largest category (n=239; 48.3%). Additionally, 2 items were identified as D100-Food Processing objects (i.e., containers), with another two objects being C020-Adornment (i.e., beads).

The food service items were exclusively unidentifiable tableware. Four items were marked with lettering; three of these were illegible while one item was marked with two white letters, a W and U on a colourless glass background. Two pieces appeared to be moulded, one shard was colourless while the other was a pale blue shard. Five pieces appeared to be etched or cut, three of which were pale pink glass shards, one a fragment of colourless glass, and the other a fragment of yellow glass. Numerous other undecorated pieces were found in a range of colours including black, blue, brown, green, and orange.

Both beads were round, cobalt blue beads drilled through the centres.

Table 13. Summary of Glass Artefacts Recovered by Test Pit

5.4.3 *Other Inorganic, Organic and Composite Artefacts Excluding Metal and Bone Objects*

A total of 1721 objects, being manufactured from material other than ceramic or glass, fell into this analytical group. Bone materials were also excluded from this category as they were analysed separately by a faunal specialists (see Appendix I). Objects in this grouping included items made from coal (n=4), metal (n=1218), plastic (n=42), paper (n=1), stone (n=170), as well as plant/botanical items (n=281) and objects whose material was unidentifiable (n=5).

These items fell into a variety of categories including 01-Structure (n=160), 02-Furnishing (n=1), 03-Personal Artefacts (n=3), 04-Tools and Equipment for Materials (n=257), 05-Tools and Equipment for Science and Technology (n=4), 06-Tools and Equipment for Communication (n=1), 08-Communication Artefacts (n=2), and 10-Unclassifiable Artefacts (n=1293).

Structural items were exclusively A040-Building components, which included a metal bracket or corner joint (n=1), handles/latches (n=2), a hinge (n=1), and 155 pieces of mortar.

The single Furnishing item consisted of a metal closure (i.e., bottle cap).

The three Personal Artefacts consisted of a ring and two button, one of wood the other of shell.

Nails overwhelming comprised the largest artefact type in the Tools and Equipment for Materials category (n=245). A variety of lesser objects cutlery (n=1), pail handles (n=4), stake/peg (n=1), safety pin (n=1) and other metal hardware (n=5) comprised the remainder of this collection.

Pieces of a relatively modern watch mechanism comprised the totality of the Tools and Equipment for Science and Technology category.

The single object in the Tools and Equipment for Communication category was a piece of slate believed to have come from a school writing tablet.

Two coins, both classified as Communication Artefacts were recovered. Both objects came from Unit 905N-900E. One was a 1820 coin lacking in a stamped value and believed to have been a Merchant's Token (Plate 7). The second coin is a silver five-cent piece dated to 1885 (Plate 8).

Table 15. Summary of Other Inorganic, Organic, and Composite Artefacts Recovered by Test Pit Excluding Bone Objects

Faunal Artefacts

A total of 153 faunal remains were recovered during the 2011 field season excavations. This material represents 4.9% of the overall collection of artefacts. Analysis of the material was conducted by Norbert Stanchly, AS&G Archaeological Consulting, in accordance with the *2011 Standards and Guidelines for Consultant Archaeologists*. A complete report of the analysis is found in Appendix I of this document.

6.0 ANALYSIS

The variety of objects recovered are consistent with a moderately prosperous 19th century homestead. The types of ceramic wares is in keeping with the English nature of the early Oshawa community, and the variety in wares (e.g., different transfer patterns, featherwares, etc.) and colours of wares (e.g., cobalt blue, deep green, etc.) is to be expected for a house with a prolonged occupation and multiple families.

The food refuse (Appendix I) is also in keeping with what might be expected of a 19th century Euro-Canadian household. The occupants of the house relied primarily on traditional European animals, including sheep, cow, and chickens although it is not clear at this time if they kept these animals themselves or purchased the meat. What is surprising about the faunal assemblage is the low presence of fish considering the house's close proximity to the lake and harbour. Only 4 specimens of Bullhead Catfish were noted in the collection and these likely came from the creeks or upper marshy part of the harbour rather than the lake proper.

The discovery of the large number of nails, metal fittings, paned glass, and botanical remains in Unit 900N-885E is suggestive that a small structure, possibly a gardening shed, was located in this area. Although several small wooden houses were located in what is now Lakeview Park during the early 1920s, it is unlikely that these artefacts date to that period due to their depth, and proximity to Henry House. It should be noted that the location of these 20th century buildings is not clearly recorded so their exact locations are unknown.

The rock wall located in Unit 905N-900E was unexpected and may be indicative of an unrecorded root cellar or earlier construction, and is worthy of further investigation.

The quantities of slag recovered from the various excavation levels indicates that coal was being used to heat the house. While the material was recovered from all levels, it is not possible to clearly identify at what time coal was being used.

Along with the cultural features, the excavations also documented the presence of a stratum of smoothed rocks, laid in a relatively horizontal manner in all units except Unit 905N-900E. These rocks were largest in the two southern units and became progressively smaller in Unit 905N-890E and Unit 905N-885E. As this stratum is immediately upon subsoil, and as the southern units and eastern portion of Unit 905N-890E were a denser clay material it is believed that this is indicative of an earlier shore line. The absence of a clear, equivalent stratum in Unit 905N-900E may be accounted for by the excavation of the area in association with the rock wall feature.

7.0 CONCLUSIONS

The archaeological excavations bear out the historical record of 19th century occupation for the house. Moreover, they attest to the fact that the Henry family, and subsequent occupants, primarily used items of English origin or style. The nature of the material is typical for a modestly prosperous family as is alluded to in the historical records.

8.0 RECOMMENDATIONS

Henry House is a historic heritage resident and an important part of the Oshawa history. Excavations at the house have produced tantalising glimpses into the early occupation of the house and the true nature of the occupants' possessions. These excavations also have hinted at the possible presence of buried structural features not documented in the historic record. The house is protected by The City of Oshawa as a historic site and is not in foreseeable danger of development therefore it is not necessary to move to either a Stage 4 excavation or make a case for an Avoidance Strategy. However, superficial modifications to the house and property are likely for accessibility issues suggesting that continued Stage 3, 1x1 metre excavations be allowed on the property to further explore the potential undocumented constructions at the house and in an attempt to gain further knowledge about the early history of Oshawa.

APPENDIX I:

FAUNAL ANALYSIS

by

Norbert Stanchly
AS&G Archaeological Consulting

INTRODUCTION

This report summarizes the results of the analysis of 153 faunal specimens (i.e. bone, tooth and shell) presented to the author for analysis. The faunal material represents the total assemblage recovered during the 2011 field season of excavation. The analysis meets the minimum standards for faunal remain specialist studies as presented in Table 6.3 of the *2011 Standards and Guidelines for Consultant Archaeologists*.

Mammal species identified include domestic cow (*Bos taurus*), pig (*Sus scrofa*), domestic rabbit (*Oryctolagus cuniculus*), sheep (*Ovis aries*) and muskrat (*Ondatra zibethicus*). The only identified species among the bird specimens is domestic chicken (*Gallus gallus*). The only identified fish is the brown bullhead (*Ameiurus nebulosus*). With the exception of the muskrat, and possibly the domestic rabbit, the remaining specimens likely represent food refuse.

A total of 20 bones exhibited signs of modification in the form of butchering, intentional polishing, and exposure to varying degrees of heat. With the exception of a single specimen, all heat altered specimens were calcined.

METHODS

The faunal sample was initially sorted into identifiable and unidentifiable groups. Specimens were considered identifiable if they possessed diagnostic morphological characteristics that enabled their identification to zoological class or lower taxon.

For all identifiable bone and tooth specimens the following observations were recorded when possible: lowest zoological taxon; element or portion thereof represented and side; age estimates (based on the degree of epiphyseal fusion), and any natural or cultural modifications.

Quantification of the assemblage is presented as the number of identifiable specimens (NISP). These provide the relative abundance of the identified taxa. Given the preliminary nature of both the excavations at Henry House and the faunal analysis, no attempt is made at this point to undertake any more meaningful quantification of the assemblage such as MNI (minimum number of individuals), biomass (based both on MNI and bone weight), and meat cut analysis.

GENERAL CHARACTERISTICS OF THE HENRY HOUSE FAUNAL REMAINS

Of the 153 specimens presented for analysis, 129 (84.3%) are of mammalian origin, nine (5.9%) are avian, six (3.9%) are fish, and two (1.3%) are molluscan. Seven bone specimens could not be identified to zoological class. The 146 identifications made of this faunal material are shown in Table 1.

MAMMAL – CLASS MAMMALIA

Mammals account for 129 of the specimens identified to zoological class. Of these, 102 could not be identified below the level of class. The remaining 27 specimens include representatives of domestic cow, pig, sheep, rabbit, and muskrat. Six specimens could be identified to zoological order or family and were found to include artiodactyl, carnivore and rodent bones. As expected, the majority of identified mammals, ca. 67%, are domesticated animals.

Taxon	NISP	% NISP
Mammalia		
<i>Bos taurus</i>	5	3.42
cf. <i>B. taurus</i>	1	0.68
<i>Ovis aries</i>	8	5.48
<i>Sus scrofa</i>	3	2.05
<i>Oryctolagus cuniculus</i>	2	1.37
<i>Ondatra zibethicus</i>	2	1.37
Order Artiodactyla	4	2.74
Order Carnivora	1	0.68
Order Rodentia	1	0.68
Indeterminate mammal	102	69.86
Aves		
<i>Gallus gallus</i>	5	3.42
cf. <i>G. gallus</i>	1	0.68
Indeterminate bird	3	2.05
Osteichthyes		
<i>Ameiurus nebulosus</i>	1	0.68
Family Ictaluridae	1	0.68
Indeterminate fish	4	2.74
Pelecypoda		
Family Unionidae	2	1.37

Table 16: Henry House Faunal Frequencies**Domestic cow (*Bos taurus*)**

Five specimens are identified as cow. These include two teeth, and portions of a rib, lumbar vertebra and scapula. The rib and scapula are both saw cut butchered with the scapula being sawn sagittally.

Pig (*Sus scrofa*)

The three pig specimens include portions of a thoracic vertebra, a proximal phalanx and a fifth metatarsal. The thoracic vertebra has been cleaved transversely. There are also two cut marks present on the vertebra. Both the phalanx and vertebra are from an immature animal.

Sheep (*Ovis aries*)

A total of eight specimens are identified as domesticated sheep. These include portions of a lower first molar, thoracic vertebra and tibia, and five complete carpal, tarsal and hind foot bones. The thoracic vertebra is from an immature animal.

Rabbit (*Oryctolagus cuniculus*)

The two specimens identified as domestic rabbit include a complete humerus and a partial sacrum. It is unclear if the presence of these bones is the result of food refuse or perhaps the partial remains of a pet rabbit.

Muskrat (*Ondatra zibethicus*)

Two partial left femurs are identified as muskrat. The femurs are from two individuals, including one immature animal. The presence of muskrat bones may indicate that they were hunted for their fur or that they are intrusive elements in the assemblage rather than food refuse. However, this is unclear at this point.

Even-toed Ungulates (Order Artiodactyla)

A total of 4 specimens were identified. These include a partial rib from a juvenile animal, a partial proximal phalanx and xiphoid process from an immature large animal and a partial long bone (femur?) from a large juvenile animal. The sizes of the bones indicate that they may be from a young cow or pig but none of the specimens are identifiable to a genus or species.

Carnivore (Order Carnivora)

A single specimen, a complete proximal phalanx, is identified as carnivore. Although a secure identification to species could not be made, the phalanx is similar to that of a medium sized carnivore such as a racoon.

Rodent (Order Rodentia)

A partial shaft from a right femur is identified as rodent. The size of the bone and its general morphology suggests that it may be from a muskrat however, the specimen does not possess any diagnostic morphological characteristics to allow for its secure identification.

BIRD – CLASS AVES

Bird bone accounts for nine specimens. Of these, five are chicken bones and at least one additional bone is likely from a chicken as well. The chicken bones include vertebra, wing and leg elements.

FISH – CLASS OSTEICHTHYES

Only one of the six fish bones was identifiable to species. This is a partial right dentary of a brown bullhead catfish. The remaining specimens include a partial cleithrum from an unidentified catfish, a partial vertebra, and unidentifiable cranial fragments.

BIVALVE – CLASS PELECYPODA

Two bivalve fragments were recovered and presented for analysis. Neither is identifiable beyond the unionid family. These may not represent food refuse.

DISTRIBUTION OF THE FAUNAL REMAINS

The faunal assemblage was recovered from 12 one-metre square excavation units. All units yielded faunal material. Unit 905N-900E yielded the highest frequency of material (Table 2).

Excavation Unit	No. of Specimens	% of Total Assemblage
895N-885E	1	0.65
895N-905E	1	0.65
900N-885E	24	15.69
900N-890E	15	9.80
900N-895E	2	1.31
900N-910E	1	0.65
905N-885E	26	16.99
905N-890E	33	21.57
905N-895E	1	0.65
905N-900E	47	30.72
910W-890E	1	0.65
915N-900E	1	0.65

Table 17: Distribution of Henry House Faunal Assemblage by Excavation Unit

There were no specific patterns observed in the distribution of material by taxa.

DISCUSSION

The faunal assemblage presented for analysis consisted of 153 bone, tooth and shell specimens. Identified species include several mammalian domesticates, bird, and fish. The small amount of faunal material is likely a reflection of the early stages of fieldwork at the Henry House site. All of the identified domestic species are taxa one would expect to find in a Euro-Canadian archaeological context. The wild fauna, i.e. muskrat, brown bullhead catfish, and unionid bivalve, are all taxa common in the area during the 19th century.

Given the early stages of excavation of the Henry House site and the resulting small faunal assemblage, little can be said regarding historic subsistence practices at Henry House beyond the limited interpretations provided above.

Acknowledgements.

I thank Dr. Helen R. Haines for entrusting me with the analysis of the Henry House faunal material. I also thank Dr. Kevin Seymour, Assistant Curator in Vertebrate Palaeontology, for granting access to the skeletal reference collections housed in the Department of Natural History.
